

The Engagement Loop Full Web3 Retention System Architecture

Every system. Every connection. Every feedback loop. The architecture behind a Web3 community that retains 70%+ of holders past 90 days.

KEY DESIGN PRINCIPLES

- 01**

Zero Admin

Every timing event — season resets, reward payouts, energy regen — runs on automated cron. The system operates at 2am without anyone watching.
- 02**

Dual Entry

Discord auth creates a free funnel of real users. NFT-gated premium tiers create the revenue layer. Both co-exist without friction.
- 03**

Circular Economy

Tokens are earned, spent, and burned in a closed loop. No external withdrawal means no price attack vector. Sinks sustain scarcity.
- 04**

Anti-Churn Stack

Lock penalty + anti-sell + vengeance window create three independent costs to leaving. Leaving is always more expensive than staying.
- 05**

No Node.js

Entire backend runs on PHP/MySQL + cron. No npm dependency chain. No supply chain attack surface. Deploys on standard shared hosting.
